

Lab 1: Bash Practice

Instructions

Log in to the classes.csc server through PuTTY or another SSH client

Programs you will interact with for this lab are found in my lab folder.

The path to this is `/classes/cs3304/cs3304_don/class/lab_1/`

Or from your home directory: `~/../cs3304_don/class/lab_1/` you

can run:

```
$ cp /classes/cs3304/cs3304_don/class/lab_1/Password ~/
```

To copy the file needed to your home directory, or just work out of the directory

Problem 1: Get past the bouncer

Rumors have it all the cool kids have access to a super-secret club. You need to get the password right for their bouncer program: Password.

- (1) Try running Password. What happens? **It starts bullying me**
- (2) Can you get into the club? **No**

Dang, it sucks that we don't know the password 😞. If only there was a way we could get it...

Question 1: is there a tool, command, or program on linux that can pull out text from something? Text in coding is often referred to as **strings**, so maybe that could be an option.

Strings Password

Question 2: If you've found this tool... try using it on the Password program. What are the last 3 lines it outputs?

.dat, .bss, .comment

Question 3: Now we COULD just scroll through all of this output... but we're lazy. We know that good passwords should be at least 8 characters long. How can we tell our newfound command to only print out strings of at least 8 characters in length? (give the option you can specify)

Strings -n 2 Password

Question 4: That certainly cut down on the number of items on our screen, but we still have too many things to look through! A good password should also have a number in it somewhere! If we wanted to pull out only the results that

have at least one number in them, we could use **grep**. **grep** is a powerful pattern-matching search tool that can refine our output. Specifically, we can use **grep** `[[:digit:]]` to pull any line of text that has at least one digit (0,1,..9) in it! Combine these two commands in one line using the pipe operator (`|`).

```
Strings -n 2 Password | grep [[:digit:]]
```

Now that's MUCH better! We should be able to see something that looks like a password!

Question 5: Use the output of the previous questions to find the password to the bouncer program. What is the correct password to the club?

GumboThaKat32!

Note, this will only work on the version of the program located at:
`/classes/cs3304/cs3304_don/class/lab_1/`

BE SURE TO COLLECT YOUR
